

Interview by  
Dr. Ronald Ferdinand Grossarth Maticcek

With Isabel Metzger  
Corona pandemic as a multi-causal problem. The Grossarthche  
Strategy.

- Mr. Grossarth: You are the founder of multicausal research in the Preventive medicine (especially in relation to cancer) and Political psychology (radicalism, anti-Semitism, democracy). so do you have a small study on the subject of corona pandemic as a multi-causal issue Problem.

- Butcher: What are the main characteristics of your multicausal pandemic Research?

- Grossarth: The multicausal research sets itself apart from the monocausal, Dogmatic and somewhat one-sided conception in which you enter the analysis of the problem includes other relevant factors.

- Metzger: What factors do you think of?

- Grossarth: In addition to the spontaneous recovery after the virus infection, the Vaccination and competent, fear-free self-regulation are important.

It also depends on the sequence of the individual measures. I could show that the most successful prevention happens when the first Recovery from infection occurs, following with concurrent vaccination Stabilization through fear-free self-regulation and keeping the Organism (e.g. admission of fever).

- Metzger: What is the difference to the representatives of the monocausal concept?

- Grossarth: These put the vaccination in the foreground and also the Measure of insulation. They do not take into account the consequences of the Intervention and prevention partly the possibility of a spontaneous one Recovery from infection.

- Metzger: According to your theory, Mr. Joshua Kimmich acted correctly in the He only got vaccinated after the infection.

- Grossarth: That's right

- Butcher: What is the best way out of the Grossarthchen strategy

- Grossarth: First infection and spontaneous recovery, then massive vaccination with simultaneous training of competent self-regulation (e.g. through multiple answers to the Grossarthchen questionnaire on measurement and Stimulation of self-regulation.

If vaccinated first, it is not enough to reduce side effects and prevent further infection by the virus and its mutants.

The same goes for recovery without vaccination

Vaccination after recovery with good self-regulation gives absolute protection of complications and new infections.

Grossarth's strategy is: first recovery, then vaccination with simultaneous training fearless self-regulation.

- Butcher: What is the fear?

- Grossarth: The paralyzing fear is a significant risk factor for bad ones Prognosis after the viral infection.
